Angular Material Angular Material is a collection of UI components based on the very own Google Material design language. Developers believe data binding is a potent tool in software development. It can automatically generate development server, unit and framework testing, view, directives and more. Angular JS supports the MVC pattern, and it has a model, view, and controller working separately. Some features that set Restangular apart from \$resource are HTTP method support, self-linking element, promises usage and many more. It provides additional attributes and makes the web pages responsive by extending the HTML DOM. You can inspect and highlight DOM elements as you hover over a scope. Angular JS helps in building large-scale, high-performance, easy-to-use, and easy-to-maintain web applications. Karma Karma is a great test runner made for Angular, but can also be used with any other Javascript framework. The view is the projection of the implemented model, and the model is considered the master class or single source of truth in the application. It supports a two-way data binding model, which attracts many developers to use it. There is no way to update the model from view, which results in data binding in one direction mainly used in classical template systems.
